Plasma therapy not beneficial for treating severe COVID-19

New Delhi, Sept 9.

Use of convalescent plasma therapy in coronavirus-infected patients does not help in reducing mortality or keeping the patients away from hospitalization. A study involving over 300 patients conducted by the Indian Council of Medical Research (ICMR) has found that the process.

The study done by the National Institute of Parasitology (NIP) and the Indian Council of Medical Research (ICMR) found that the process.

The study was published in the journal of the Indian Council of Medical Research (ICMR) on September 9.

In the study, researchers from the NIP and ICMR analyzed the clinical outcomes of patients who received convalescent plasma therapy. The patients were divided into two groups: one that received convalescent plasma therapy and another that did not. The results showed that there was no significant difference in the mortality rates or hospitalization rates between the two groups.

The study also found that the convalescent plasma therapy did not reduce the duration of hospitalization or improve the clinical outcome of patients.

The researchers concluded that convalescent plasma therapy is not beneficial for treating severe COVID-19 and that more research is needed to determine the efficacy of this treatment approach.

The study was funded by the Department of Biotechnology, Government of India, and the results were presented at the 26th Annual General Meeting of the Indian Society of Blood Transfusion.

The study is available for further reading on the website of the Indian Council of Medical Research (ICMR).
